

whisper-large-v3-turbo

Automatic Speech Recognition • OpenAI

@cf/openai/whisper-large-v3-turbo

Whisper is a pre-trained model for automatic speech recognition (ASR) and speech translation.

Model Info

Unit Pricing	\$0.00051 per audio minute
--------------	----------------------------

Usage

> Workers - TypeScript

Parameters

* indicates a required field

Input

- **audio** **string** required

Base64 encoded value of the audio data.

- **task** **string** default transcribe

Supported tasks are 'translate' or 'transcribe'.

- **language** **string**

The language of the audio being transcribed or translated.

- **vad_filter** **boolean**

Preprocess the audio with a voice activity detection model.

- **initial_prompt** **string**

A text prompt to help provide context to the model on the contents of the audio.

- **prefix** **string**

The prefix is appended to the beginning of the output of the transcription and can guide the transcription result.

Output

- **transcription_info** **object**

- **language** **string**

The language of the audio being transcribed or translated.

- **language_probability** **number**

The confidence level or probability of the detected language being accurate, represented as a decimal between 0 and 1.

- **duration** **number**

The total duration of the original audio file, in seconds.

- **duration_after_vad** **number**

The duration of the audio after applying Voice Activity Detection (VAD) to remove silent or irrelevant sections, in seconds.

- **text** **string** required

The complete transcription of the audio.

- **word_count** **number**

The total number of words in the transcription.

- **segments** **array**

- **items** **object**

- **start** **number**

The starting time of the segment within the audio, in seconds.

- **end** **number**

The ending time of the segment within the audio, in seconds.

- **text** **string**

The transcription of the segment.

- **temperature** **number**

The temperature used in the decoding process, controlling randomness in predictions. Lower values result in more deterministic outputs.

- **avg_logprob** **number**

The average log probability of the predictions for the words in this segment, indicating overall confidence.

- **compression_ratio** **number**

The compression ratio of the input to the output, measuring how much the text was compressed during the transcription process.

- **no_speech_prob** **number**

The probability that the segment contains no speech, represented as a decimal between 0 and 1.

- **words** **array**

- **items** **object**

- **word** **string**

The individual word transcribed from the audio.

- **start** **number**

The starting time of the word within the audio, in seconds.

- **end** **number**

The ending time of the word within the audio, in seconds.

- ▶ **vtt** **string**

The transcription in WebVTT format, which includes timing and text information for use in subtitles.

API Schemas
